

JAVASCRIPT TEST

JS / Frontend Development

The main goal of this tech test is to create a client side web application that reproduces the screenshot on the previous page.

We will evaluate the client side code and the criteria will be based mainly on:

- Clean, maintainable, easy-to-read and unit tested code - **WILL BE A MUST**
- Good architectural practices
- Clean HTML and CSS markup

We will check by relevance:

- Produce a reusable component (View) connected to 3 different data models.
- Produce a reliable and unit tested code (we recommend Jasmine).
- There's a clear MVC separation of concerns. In order to do that, you will need a dependency management tool (we recommend you to use RequireJS).
- Pixel accuracy reproducing designs
- Good use of libraries
- Good use of pure Javascript language.

Strong considerations:

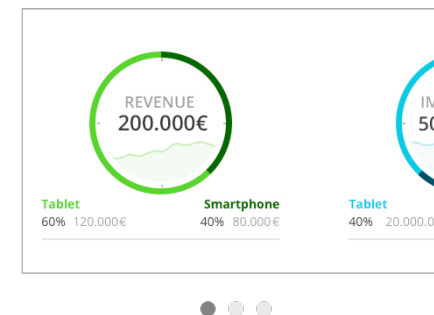

- We encourage the usage of graphic library. Eg: D3JS library
- Don't use external frameworks like jQuery, AngularJS or React JS.
- Avoid any backend development / dependency. Create a mocked communication with a fake server.

Things to evaluate:

- Produce a reusable component (View) connected to 3 different data models.
- There's a clear MVC separation of concerns.
- Pixel accuracy reproducing designs
- Good use of libraries
- Good use of pure Javascript language.

Not required, but impressive:

It would be nice if the three figures are inside an animated carousel-like (or gallery) component, so the user can navigate through them horizontally. This carousel should run completely smooth, especially in a mobile device.
